

# Taking advantage of Master Files support when working with DocBook modules

Radu PISOI

[radu\\_pisoi@oxygenxml.com](mailto:radu_pisoi@oxygenxml.com)

# A sample documentation project

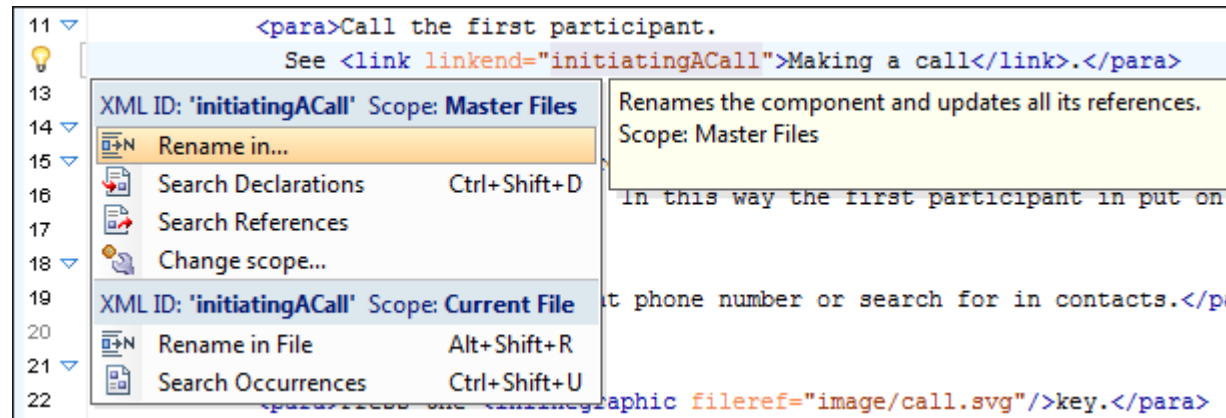

# Problems when editing a Docbook module

Because there is no schema association:

- the module is not valid
- the content completion assistant doesn't propose any elements

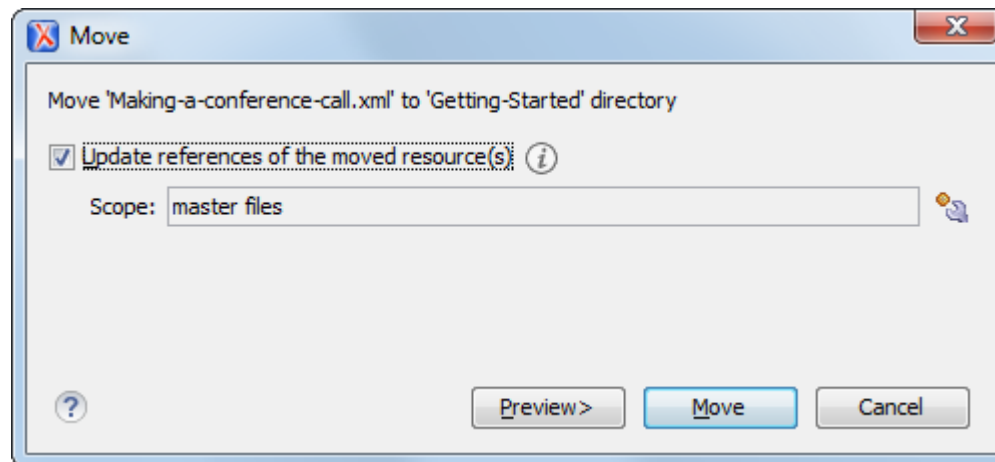

# Manage IDs

Search and refactoring actions for ID/IDREFS operate in the scope determined by the master files.

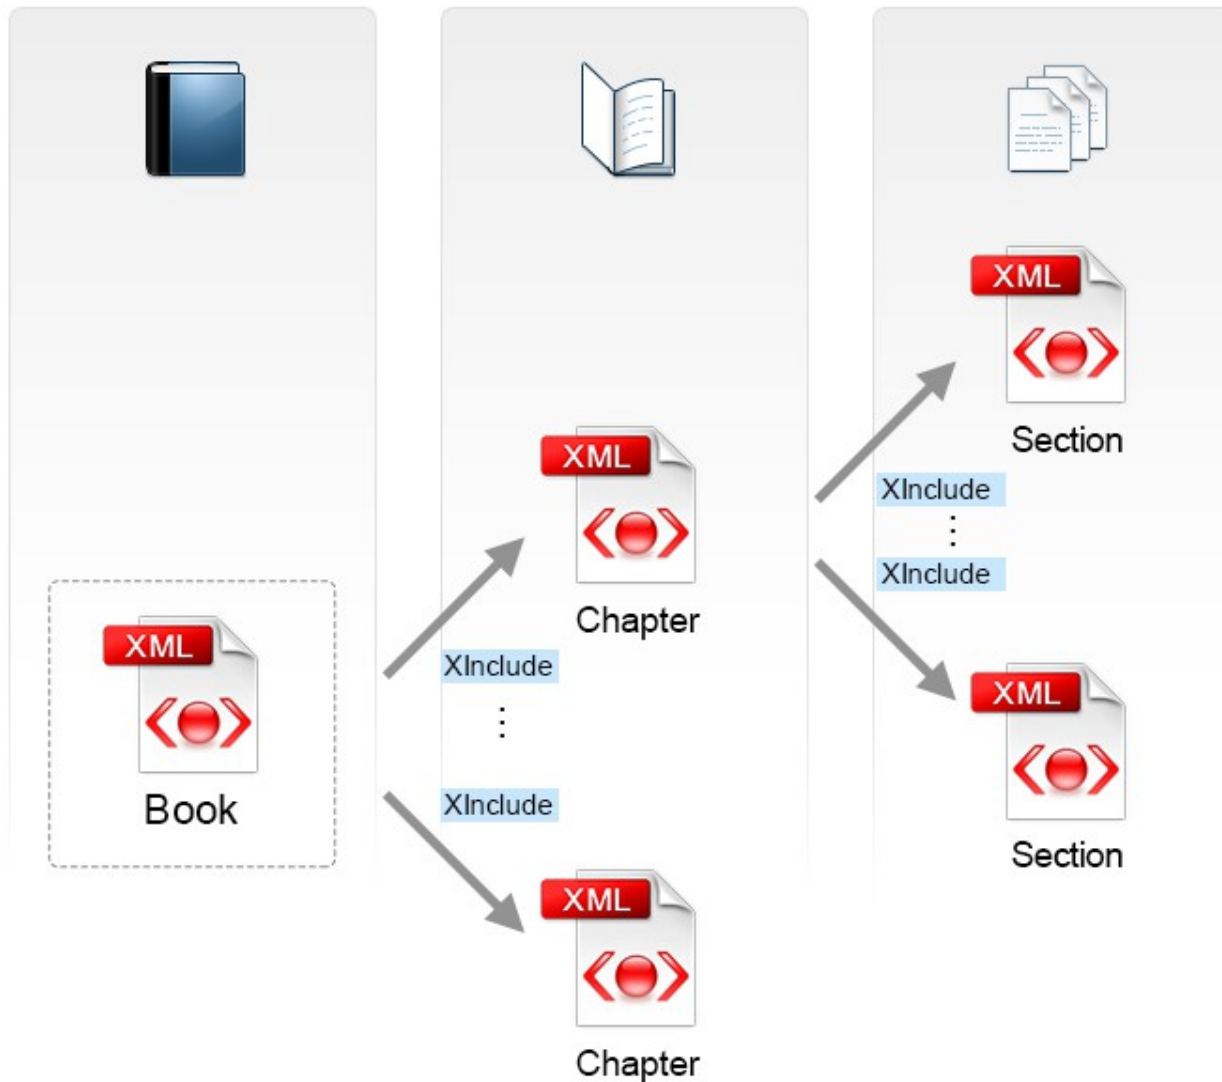

# Update XML module references when renaming or moving it

<oxygen/> automatically updates all the references to a module when the module is renamed or moved in the Project or in the Resource Hierarchy/Dependencies view.

# A DocBook 5 documentation project

# Master Files support benefits when working with DocBook modules

- Module validation
- Content completion
- Search and refactoring action for ID/IDREFS
- Update XML module references when renaming or moving it

# Thank you!
